

COMPUTER SCIENCE: SCHOOL YEAR PROJECT

PROGRESS REPORT WEEK 4

GOAL	DATA COLLECTED	PROGRESS
State your goal for the Week	State/list the data collected relevant to your project	State the progress you have made so far by the end of the week
Our goal for Week 4 was to complete the main interfaces for all the planned features of the program, which include the savings system, stipend tracking, allowance manager, and spending wallet. The aim was to have the structure and navigation of the program ready so that each feature could later be implemented inside its respective menu.	For this week, we reviewed and applied several Python concepts from existing references and learning materials. These include the use of functions to organize program features, while loops to keep menus running continuously, try-except statements for handling invalid user input, and conditional statements to check balances and transactions. We also looked at examples of simple savings tracker logic to guide the implementation of the savings feature.	By the end of Week 4, we fully implemented the savings feature, which allows users to input their savings balance, add or withdraw money, and allocate savings toward a specific item while tracking their progress toward the item's price. The other features such as stipend tracking, allowance manager, and spending wallet are already part of the interface but their internal functions still need to be implemented.
STRENGTH:	AREAS FOR DEVELOPMENT	STRATEGY FOR SUCCESS
One strength of our progress this week is that the program structure and navigation are already functioning. The savings feature is also working with input validation and balance checking, which helps prevent errors such as negative balances or invalid amounts.	The main areas for development are the remaining program features, specifically the stipend tracking, allowance manager, and spending wallet. These still need to be coded and connected to the existing menu system.	To move forward, we plan to implement the remaining features using the same structure used in the savings system. We will also test each function after implementation to ensure that it works correctly with the menu system and the rest of the program.
